

GATE

CRASH COURSE

Data Science & AI

Subject

Python - For Data Science Tuple,
Sets and Dictionaries
Lec No. 05

By – Satya Sir

Last Class

Quick Recap

- 1 Homework Question Solution
- 2 Iterative Control Statements
- 3 Unconditional Statements
- 4 Strings and Lists
- 5 Examples

Topics to be covered

1 Homework Questions Solution

2 Nested Lists

3 String Methods

4 Tuples

5 Sets and Examples

Homework Question - 1

```
for i in range(1,7,2):
```

```
    for j in range(i):  
        print(i+j)  
        if j%2==1:  
            break
```

The number of times print statement is executed is 5

Handwritten analysis of the code execution:

For $i=1$:
 $j=0$: Print 1, $0 \div 2 = 0$ (False), continue.
 $j=1$: Print 4, $1 \div 2 = 0$ (False), continue.
 $j=2$: $2 \div 2 = 1$ (True), break.
 $j=3$: Not reached.
Output: 1, 3, 4, 5, 6

For $i=3$:
 $j=0$: Print 3, $0 \div 2 = 0$ (False), continue.
 $j=1$: Print 4, $1 \div 2 = 0$ (False), continue.
 $j=2$: $2 \div 2 = 1$ (True), break.
 $j=3$: Not reached.
Output: 1, 3, 4, 5, 6

For $i=5$:
 $j=0$: Print 5, $0 \div 2 = 0$ (False), continue.
 $j=1$: Print 6, $1 \div 2 = 0$ (False), continue.
 $j=2$: $2 \div 2 = 1$ (True), break.
 $j=3$: Not reached.
 $j=4$: Not reached.
Output: 1, 3, 4, 5, 6

Final output sequence: 1, 3, 4, 5, 6

Homework Question - 2

```
for i in range(1,7,2):  
    for j in range(i):  
        print(i+j)  
        if j%2==1:  
            continue
```

The number of times print statement is executed is _____

9

$i=1$ $j=0$ Print 1

$i=3$ $j=0$ Print 3 $j=1$ Print 4 $j=2$ Print 5

$i=5$ $j=0$ Print 5 $j=1$ Print 6 $j=2$ Print 7 $j=3$ Print 8 $j=4$ Print 9

String Methods

Method	Description
<code>capitalize()</code>	Converts the first character to upper case
<code>casefold()</code>	Converts string into lower case
<code>center()</code>	Returns a centered string
<code>count()</code>	Returns the number of times a specified value occurs in a string
<code>encode()</code>	Returns an encoded version of the string
<code>endswith()</code>	Returns true if the string ends with the specified value
<code>expandtabs()</code>	Sets the tab size of the string
<code>find()</code>	Searches the string for a specified value and returns the position of where it was found
<code>format()</code>	Formats specified values in a string
<code>format_map()</code>	Formats specified values in a string
<code>index()</code>	Searches the string for a specified value and returns the position of where it was found
<code>isalnum()</code>	Returns True if all characters in the string are alphanumeric
<code>isalpha()</code>	Returns True if all characters in the string are in the alphabet
<code>isascii()</code>	Returns True if all characters in the string are ascii characters
<code>isdecimal()</code>	Returns True if all characters in the string are decimals
<code>isdigit()</code>	Returns True if all characters in the string are digits

String Methods

Method	Description
<code>isidentifier()</code>	Returns True if the string is an identifier
<code>islower()</code>	Returns True if all characters in the string are lower case
<code>isnumeric()</code>	Returns True if all characters in the string are numeric
<code>isprintable()</code>	Returns True if all characters in the string are printable
<code>isspace()</code>	Returns True if all characters in the string are whitespaces
<code>istitle()</code>	Returns True if the string follows the rules of a title
<code>isupper()</code>	Returns True if all characters in the string are upper case
<code>join()</code>	Converts the elements of an iterable into a string
<code>ljust()</code>	Returns a left justified version of the string
<code>lower()</code>	Converts a string into lower case

String Methods

Method	Description
<code>lstrip()</code>	Returns a left trim version of the string
<code>maketrans()</code>	Returns a translation table to be used in translations
<code>partition()</code>	Returns a tuple where the string is parted into three parts
<code>replace()</code>	Returns a string where a specified value is replaced with a specified value
<code>rfind()</code>	Searches the string for a specified value and returns the last position of where it was found
<code>rindex()</code>	Searches the string for a specified value and returns the last position of where it was found
<code>rjust()</code>	Returns a right justified version of the string
<code>rpartition()</code>	Returns a tuple where the string is parted into three parts
<code>rsplit()</code>	Splits the string at the specified separator, and returns a list
<code>rstrip()</code>	Returns a right trim version of the string

String Methods

Method	Description
<code>split()</code>	Splits the string at the specified separator, and returns a list
<code>splitlines()</code>	Splits the string at line breaks and returns a list
<code>startswith()</code>	Returns true if the string starts with the specified value
<code>strip()</code>	Returns a trimmed version of the string
<code>swapcase()</code>	Swaps cases, lower case becomes upper case and vice versa
<code>title()</code>	Converts the first character of each word to upper case
<code>translate()</code>	Returns a translated string
<code>upper()</code>	Converts a string into upper case
<code>zfill()</code>	Fills the string with a specified number of 0 values at the beginning
<code>split()</code>	Splits the string at the specified separator, and returns a list

Strings

s = 'Gate'

Print(s.lower()) # gate

Print(s.upper()) # GATE

Print(s.isalpha()) # True

Print(s.isnumeric()) # False

Print(s.isascii()) # True

Print(s.islower()) # False

Print(s.isupper()) # False

Print(s.center(10))

-----Gate-----

Print(s.center(10, '#'))

###Gate###

Nested Lists

Add Elements to the list

`l = [11, 22]`

11	22
----	----

`l.append(33)`

11	22	33
----	----	----

`l.append(55)`

11	22	33	55
----	----	----	----

`l.append(44)`

11	22	33	55	44
----	----	----	----	----

`print(l)` `# [11, 22, 33, 55, 44]`

`append()` method add elements
by default at the end of the list

`l = [10, 20, 30, 40]`
Index value

`l.insert(3, 5)`

`l.insert(-2, 4)`

`l.insert(-1, -3)`

`l.insert(2, 3)`

`print(l)`

0	1	2	3
10	20	30	40
-4	-3	-2	-1

0	1	2	3	4
10	20	30	5	40
-5	-4	-3	-2	-1

0	1	2	3	4	5
10	20	30	4	5	40
-6	-5	-4	-3	-2	-1

0	1	2	3	4	5	6
10	20	30	4	5	-3	40

0	1	2	3	4	5	6
10	20	3	30	4	5	-3
-7	-6	-5	-4	-3	-2	-1

Question

Remove / Delete Elements from the lists

remove(), pop(), clear(), del keyword

Ex: $l = [1, 5, 7, 9, 5, 3, 7, 1, 10]$

$l.remove(5)$ # First Occurrence of given element gets removed.

$l = [1, 7, 9, 5, 3, 7, 1, 10]$

$l.pop()$ # It removes last element if index not specified.

$l = [1, 7, 9, 5, 3, 7, 1]$

$l.pop(4)$ # removes value of specified index

$l = [1, 7, 9, 5, 1, 1]$

$del\ l[2]$ # $l = [1, 7, 5, 1, 1]$

$l.clear()$ # It clears all content but list remains. # $l = []$

$del\ l$ # It removes complete list from memory

Question

- Arrays are implemented using lists in Python.
- So, multi-dimensional array is implemented in the form of Nested lists.

Examples :

$x = [10, 20, [30, 40, 50], 60]$

`Print(len(x))` # 4

`Print(len(x[2]))` # 3

`Print(x[2][1])` # 4

	0	1	2			3						
x:	10	20	<table><tr><th>0</th><th>1</th><th>2</th></tr><tr><td>30</td><td>40</td><td>50</td></tr></table>			0	1	2	30	40	50	60
0	1	2										
30	40	50										

	0		
0	10		
1	20		
2	30	40	50
3	60		

Question

$$A = [1, 3, [5, 7, 9, [2, [6, 8, -1, [0, 3, 4], 5], 7, 9], 1, 8], 2, 6, 3]$$

$$i = A[2][3][2] \quad \# i = 7$$

$$j = A[2][3][1][3][2] \quad \# j = 4$$

Print($i+j+k$)

$$\text{o/p: } 7+4+6 = \underline{\underline{17}}$$

$$k = A[2][3][1][0] \quad \# k = 6$$

Modify list Elements

Ex:

$$l = [1, 3, 5, 4, 6, 2, 8]$$

$$l[3] = 7 \quad \# \quad l = [1, 3, 5, 7, 6, 2, 8]$$

$$l[2:5] = [-3, 10, 23] \quad \# \quad l = [1, 3, -3, 10, 23, 2, 8]$$

$$l[1:2] = [10, 15, 30] \quad \# \quad l = [1, 10, 15, 30, -3, 10, 23, 2, 8]$$

$$l[3:7] = [25, 50] \quad \# \quad l = [1, 10, 15, 25, 50, 10, 23, 2, 8]$$

$$\text{Print}(l) \quad \# \quad [1, 10, 15, 25, 50, 10, 23, 2, 8]$$

Tuples

- Ordered Collection
- Supports both +ve/-ve index
- Supports duplicate values
- Supports different type of data
- Immutable Collection

- Tuples Can be Created as : `object = (values)` (or) `object = tuple()`

Ex: `t = (10, 10, 20, 'GATE', 4.79)`
`t = tuple()`

- Tuples Can be Nested as like lists
- Tuples Can be Modified as below :
 - 1) Convert tuple to list type
 - 2) Modify
 - 3) Convert list back to tuple type
- But, `clear()` and `del` keyword are valid to apply on tuples.

Unpacking Tuples

Ex:1

$$t = (10, 20, 30)$$

$$(a, b, c) = t \quad \# a=10 \quad b=20 \quad c=30$$

Ex:2

$$t = (10, 20, 30, 40, 50, 60)$$

$$a, b, *c = t \quad \# a=10 \quad b=20 \quad c = [30, 40, 50, 60]$$

Ex:3

$$t = (10, 20, 30, 40, 50, 60)$$

$$a, *b, c = t \quad \# a=10 \quad b = [20, 30, 40, 50] \quad c=60$$

Ex:4

$$t = (10, 20, 30, 40, 50, 60)$$

$$*a, b, c = t$$

$$\# a = [10, 20, 30, 40] \quad b=50 \quad c=60$$

Methods of tuples

- `index()` → returns first occurrence of given element in tuple
- `count()` → returns frequency of element in the tuple.

Ex: `L = (10, 20, 30, 10, 40, 20, 10, 50)`

`i = L.index(20)` # `i = 1`

`j = L.count(10)` # `j = 3`

`Print(j - i)` # `3 - 1 = 2`

Sets in Python

- It is unordered collection (Index is not supported)

- It does not support duplicates

- It is Immutable* [add items, remove items]

- It can be created as:

Object = { values } (or) Object = set()

- Empty set can be created through Constructor only.

Ex:

→ S = { 10, 20, 10, 20, 10 }
Print(S) # { 10, 20 } (or) { 20, 10 }

Print(type(S)) # <class, 'set'>

Ex:

S = { }

Print(type(S)) # <class, 'dict'>

Ex:

S = set()

Print(type(S)) # <class, 'set'>

Sets in Python

<u>methods</u>	<u>Equivalent operators</u>
. union()	
. intersection()	&
. difference()	-
. Symmetric_difference()	^
union_update()	=
intersection_update()	&=
difference_update()	-=
.	.
:	:

To be Contd ... 😊

Question

O/P = _____

Home Work

count = 1

x = [1, 3, 5, [7, 9, [2, 4], 6], 8]

y = (5, 7, (9, 3, 1, (6, 2), 4), 8)

i = x[3][2][1]

j = y[2][3][0]

for a in i:

for b in j:

count = count + a + b

Print(count)

Summary

- String methods
- Nested lists
- Add, remove, change operations on lists
- Tuples, unpacking, methods
- Sets

To be contd ...
